The Pfizer Vaccine

How effective is it?
How does it work?
How was it developed so fast?

Celebrity Cruises®
The Pfizer vaccine is an mRNA vaccine which means that it is an instruction for your immune system to produce antibodies against the Covid-19 virus.

So the next time you encounter the virus, you have antibodies which can fight off the virus and you don’t get sick!

Tested on 44,000 volunteers from all over the world before approved by the EMA & CDC in December 2020.

Rules for approval are always the same so this vaccine is just as safe as the vaccines that we had as children and when we travel.

Under normal circumstances
- It takes a long time to generate the necessary funding.
- It takes a long time to recruit volunteers.
- The clinical stages are done one after another.
- Pharmaceutical organizations keep their data and experience to themselves.

Due to the worldwide pandemic
- Now money was made available straight away.
- The volunteers where lining up.
- They were done at the same time but no steps where skipped.
- Now scientist worldwide shared their knowledge and experience.

Recent studies have proven that it is safe to take the vaccine for pregnant woman & children 12 years older.

95% effective
What does that mean?

100 unvaccinated persons + Covid-19 = 100 active Covid-19 cases

100 vaccinated persons + Covid-19 = 5 active Covid-19 cases

We cannot guarantee that we can provide this vaccine in the future.

Highest protection level of all vaccines!
